

## Tips for buying Hot tubs

- Make sure the spa satisfies your comfort level.
- Ease of access to the hot tub controls, the entry and exit, and it has cushioned headrests.
- Hydrotherapy: Some people like a hydro massage feeling while others just require a warm soak, review the types of jets and their arranged position
- Don't be misled by the jet tally alone. What are more important are the “jet variation” and the way the jets are located within the lounges and seats. A good hot tub should maximize the hydrotherapy experience and address all of the body's muscle groups.
- Ask how you adjust the jet flow that allows you to customize the massage and the amount of air/water supplied to the jets.
- Air Jet System: Many hot tubs feature an air jet system that produces air bubbles from fittings throughout the spa to provide a very gentle soft-tissue massage. While this isn't a necessary feature, many people enjoy the feeling it provides
- Filtration system: Generally, “premium” spas feature small circulation pumps that continuously filter the water to provide the necessary flow; this allows the heater to maintain the set temperature.
- Energy Efficiency: The hot tub you intend to buy must have good insulation for the shell, the plumbing' and a custom-fit cover
